NAP: Not Applicable

NAs: Not Asked

Note 1: Integral antenna without standard connector.

Note 2: Radio is not operational in charging mode

Note 3: See FCC part 15.247 (d).

Note 4: See FCC part 15.209. Unwanted emissions levels are all below the fundamental emission field strength level.

Note 5: The minimum 6 dB bandwidth of the equipment is 508 kHz (see appendix 4).

Note 6: Conducted measurement is not possible (integral antenna), so we used the radiated method in anechoic room and added the antenna gain.

**RF EXPOSURE:**

In accordance with KDB 447498 D01 General RF Exposure Guidance v06, Paragraph 4.3.1.

Maximum measured power = 94.7 dB $\mu$ V/m = 0.000540 W at 2404 MHz

with  $P = (E \times d)^2 / (30 \times G_p)$  with  $d = 3 \text{ m}$  and  $G_p = 1.64$

The test separation distance declared is 5 mm

**The product must respect the exclusion limit for 10-g extremity SAR.**

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] * [\sqrt{f(\text{GHz})}] \leq 7.5$

According this formula:

$\text{Min. test separation distance, mm} \geq [(\text{max. power of channel, including tune-up tolerance, mW}) * \sqrt{f(\text{GHz})}] / 7.5$

$\text{Min. test separation distance, mm} \geq [0.54(\text{mW}) * \sqrt{(2.404)}] / 7.5$

$\text{Min. test separation distance, mm} \geq \mathbf{0.11 \text{ mm}}$  (with a minimum value of 5 mm)

The minimum distance between the user and the antenna is greater than 5 mm (see photos in appendix 1).

**The equipment fulfils the requirements on maximum conducted or equivalent isotropically radiated power (e.i.r.p) for general population/uncontrolled exposure and therefore fulfils the requirements of 47 CFR §1.1310 at the distance greater than 5 mm between the user and the antenna.**

**7. MEASUREMENT UNCERTAINTY**

To declare, or not, the compliance with the specifications, it was not explicitly taken into account of uncertainty associated with the result(s)

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor  $k=2$ , which for normal distribution corresponds to a coverage probability of approximately 95%.

## Band edge worst case measurement (band 2.31GHz to 2.39GHz)

**Applicable limits:** In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The highest level recorded in a 100 kHz bandwidth is 94.6 dBμV/m on High channel.

So the applicable limit is 74.6 dBμV/m.

In addition, radiated emissions which fall in the restricted band, as defined in section 15.205 (a), must also comply with the radiated emission limits specified in section 15.209 (a) (see section 15.205 (c)).
